## Concept Searching Announces New Release & Product Enhancements

### Full Support for Microsoft SharePoint Content Types and Increased Support for Multiple Taxonomies Now Available

McLean VA – March 16 – Concept Searching, announced today that Version 4 of its flagship product, concept**Classifier** for SharePoint is now available and has shipped to existing clients. Features include a new installer that enables installation in a SharePoint environment in less than 20 minutes, requires no programmatic support, and all functionality can be turned on or off using standard Microsoft SharePoint controls. Continuing to invest in product enhancements and client requirements, full integration with Microsoft Content Types and greater support for multiple taxonomies are also included in this release.

Enterprises are increasingly understanding the value and critical need to utilize Content Types to structure their content and identify the type of document regardless of its physical site or library storage location. Content Types can be used to enforce metadata governance, adhere to policies and drive workflows in line with business processes. Included in the new release is the ability to assign taxonomies to specific Content Types. Documents that correspond to the selected Content Types will be classified and documents that do not correspond to a content type or do not include some metadata elements that a specific content type has specified will not be classified. This essential functionality allows different taxonomies to be assigned to different Content Types for example, assign the HR taxonomy to all Content Types of type “HR”, including any Content Types derived from “HR” and assign the Finance taxonomy to all Content Types of type “Finance”, including any Content Types derived from “Finance”.

The configuration can be performed using a wizard that runs inside SharePoint. The taxonomies will be available for these documents regardless of their location. concept**Classifier's** site columns and Event Handlers are associated to the Content Types. This delivers the ability to automatically add classification functionality to new sites when created.

According to Martin Garland President of Concept Searching, “We are finding that our customers rolling out large scale SharePoint deployments understand the benefits of metadata tagging and deploying Content Types to enforce both tagging and content governance aligning policy and process. As the only Microsoft Partner to offer a semantic metadata generation, content tagging, taxonomy development and auto-classification solution that now fully supports Content Types and multiple taxonomies we have been able to deliver the functionality that our clients require.”

#### About Concept Searching

Founded in 2002, Concept Searching’s concept**Classifier** for SharePoint technology platform provides advanced semantic metadata generation, compound term processing, automatic classification and

taxonomy management, fully integrated with Microsoft Office, Microsoft Office SharePoint Server 2007 and Microsoft Search Server 2008. Concept Searching is the only statistical metadata generation and classification software company in the world that uses concept extraction and compound term processing to significantly improve access to unstructured information. The technology platform leverages compound term processing and stores the automatically generated semantic metadata directly within SharePoint properties, fully integrating the classification schemas with Search Server 2008. concept**Classifier** for SharePoint greatly increases precision and relevancy and offers users both a faceted or browsable taxonomy search experience. Headquartered in the U.K. with offices in the U.S. and South Africa, Concept Searching solves the problem of finding, organizing, and managing information capital.
